

COMMITMENT INTELLIGENCE · HACKATHON MVP

CommitMind: The AI That Never Lets Important Commitments Slip

Turning scattered promises into clear, actionable responsibilities.

Every promise deserves a follow-through.

Team: KERNEL · Members: ADHYAYAN CHANCHAL, SHUBHAM AGARWAL, KENISHA, SHAURYA

LLOYD INSTITUTE OF ENGINEERING AND TECHNOLOGY

THE PROBLEM

Important commitments are buried everywhere

“I’ll send the report by Friday.”

“Let’s follow up with the client next week.”

“Please complete the task before the review.”

Unclear ownership, scattered information, and forgotten follow-ups create delays and missed expectations.

THE GAP

Reminders start too late.

The commitment often begins before a task ever exists.

01 Manual task creation

Traditional reminders and task managers often depend on someone noticing the promise and entering it.

02 Memory becomes the system

People must remember what was promised, where it appeared, and by when.

03 Automation still misses the origin

Existing tools may automate follow-up, but the commitment starts earlier, inside a conversation or document.

THE PRODUCT

CommitMind adds a commitment intelligence layer

It turns authorized source material into reviewable, prioritized responsibilities.

01

Ingest

Authorized emails, documents, and meeting notes.

02

Identify

AI and natural language processing find commitments.

03

Extract

Owner, action, deadline, source, and confidence.

04

Confirm

Ambiguous meaning comes back to the user.

05

Follow through

Prioritized action lists and follow-up alerts.

SYSTEM FLOW · PROPOSED

From scattered text to the next best action

Every commitment keeps a path back to the source, with a human checkpoint before it becomes actionable.

Human confirmation checkpoint · Uncertain owners or deadlines are flagged for review before action is created.

PROPOSED CAPABILITIES

Everything needed to keep a promise moving

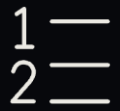

Detect

Automatic commitment detection.

Extract

Deadline and owner extraction.

Prioritize

Priority-based action dashboard.

Remind

Smart reminders and overdue alerts.

Verify

Source-linked commitments for verification.

Advance

Follow-up suggestions and status tracking.

Coordinate

Team accountability with appropriate permissions.

ILLUSTRATIVE · NOT A RESULT CLAIM

One email becomes a clear next step

The value is not another inbox flag. It is a commitment a person can review, verify, and move forward.

Scenario: an email asks for a revised proposal by Friday.

PENDING · ILLUSTRATIVE

Send revised proposal

Email: “Could you send the revised proposal to Priya by Friday?”

OWNER

Recipient · subject to confirmation

SOURCE

Original email

DEADLINE

Friday · exact date confirmed if necessary

NEXT ACTION

Review the proposal and send it before the deadline.

Reminder timeline · Confirm owner → Review proposal → Send before deadline

PROPOSED MVP STACK

Built for a focused demo

Frontend

React or Next.js

Backend

Python with FastAPI

AI

LLM API with structured outputs

NLP

Text preprocessing and entity extraction

Database

PostgreSQL

Integrations

Gmail/Google Workspace or Microsoft 365 APIs, subject to authorization

Notifications

Email or in-app alerts

Proposed stack · implementation choices may change as the MVP evolves.

Tasks record work. CommitMind understands the promise behind it.

Capability	Manual task managers	Basic reminders	CommitMind's proposed capabilities
Commitment origin	Manually entered	Time-based prompt	Surfaced from source text
Traceability	Usually separate from source	Reminder context	Source-linked evidence for verification
Ownership and ambiguity	Entered by a person	Often assumed	Extracted, flagged, and confirmed where needed
Priority	User-managed	Time-triggered	Ranked by deadline and context
Cross-document context	Not the default workflow	Limited context	A proposed differentiator to explore in the MVP

TRUST BY DESIGN

Trust is part of the product, not a later feature.

Explicit authorization and least-privilege access.

Encryption, access controls, data minimization, and retention controls.

Users review and correct AI-extracted commitments.

Uncertain owners and deadlines are flagged, not silently assumed.

Sensitive data should not train models without appropriate authorization.

Proposed MVP principle: make every extracted commitment reviewable before it becomes someone’s responsibility.

THANK YOU
